SUBMISSION OF PRIORITY DOCUMENT

Assistant Commissioner for Patents
Washington, D.C. 20231

Sir:

Pursuant to rule 55(b) of the Rules of Practice in Patent Cases, Applicant(s) is/are submitting herewith a certified copy of the United Kingdom Application No. 0221739.6 filed September 19, 2002, upon which the claim for priority under 35 U.S.C. § 119 was made in the United States.

It is respectfully requested that the priority document be made part of the file history.

Respectfully submitted,

Rimma Mitelman

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

DETERGENT COMPOSITIONSTECHNICAL FIELD

- 5 The present invention relates to effervescent granules for use in particulate detergent compositions.

BACKGROUND AND PRIOR ART

- 10 Particulate laundry detergent compositions must satisfy a wide range of practical constraints. As well as providing excellent cleaning and care, they must also satisfy numerous physical constraints which go beyond this basic requirement. For example it is known that the effervescence properties of
- 15 certain added ingredients can provide improved dispensing qualities to the detergent composition. This can be achieved by adding two ingredients which react together in the presence of water to produce a gas, for example by using sodium carbonate and citric acid. It is also known to place
- 20 the two reacting components together in a single granule. Such a single granule is often referred to in the art as an effervescent granule.

- US 4 252 664 (Colgate-Palmolive) discloses the use of an
- 25 effervescent granule comprising a gas-producing agent (preferably a carbonate) and an acid (preferably a solid acid). The effervescent granule is present in the full formulation at a level of from 5 to 10 wt%.

A series of patent applications have published which disclose effervescent granules which also contain detergent ingredients such as surfactant and builder:

- 5 WO 98 42811 (Procter & Gamble) discloses a detergent granule of size 1.0 to 4.5 mm which comprises an acid source and an alkali source.

- WO 98 46714 (Procter & Gamble) discloses a substantially
10 anhydrous effervescent particle of size 0.075 to 20 mm.

- WO 98 46715 (Procter & Gamble) discloses a substantially anhydrous foaming component comprising an anhydrous surface active component (e.g. surfactant) and an effervescence
15 component (e.g. acid or alkali source).

- WO 98 46716 (Procter & Gamble) discloses a dry effervescent granule comprising an acid, a carbonate source and a binder, wherein the acid and carbonate source are in close physical
20 proximity.

- More recently, it has been discovered that effervescent granules may be improved by controlling the particle sizes of its constituents:

25

- WO 00 34422 (Procter & Gamble) discloses an effervescence component which comprises an acid source and a carbonate source wherein at least 75% of the acid source has a particle size of from 0.1 to 150 microns. Preferably the
30 carbonate source also has a defined particle size and the granule is preferably coated in a nonionic surfactant.

WO 01 30949 (Procter & Gamble) discloses a reactive particle comprising two particulate reactants in which the particle number ratio of the first reactant to the second is at least 50:1. Preferably the median particle size of the second to
5 the first reactant is at least 2:1.

The present inventors have surprisingly found that an effervescent granule which comprises an acid source and a carbonate source together with a quantity of solid
10 surfactant particles provides an effervescent granule with improved dispensing properties, improved structure and a rich foaming visual signal which provides a strong positive connotation in the mind of the end user.

15 **STATEMENT OF INVENTION**

In a first aspect, the present invention provides an effervescent granule for use in particulate detergent compositions which comprises an acid source, an alkali
20 source and solid surfactant particles.

In a second aspect, the present invention provides a laundry detergent composition which comprises from 0.1 to less than 10 wt% of an effervescent granule as defined above.
25

DETAILED DESCRIPTION OF THE INVENTION

The Effervescent Granule

30 The effervescent granule of the present invention comprises an acid source, a carbonate source and solid surfactant

particles. The acid source and carbonate source are preferably in particulate form and therefore each granule would contain discrete particles of acid and carbonate source.

5

The granule preferably comprises from 20 to 80 wt%, preferably from 30 to 60 wt%, more preferably from 40 to 50 wt% of the carbonate source. The granule preferably comprises from 10 wt% to 60 wt%, preferably from 20 wt% to 10 50 wt%, more preferably from 30 wt% to 40 wt% of the acid source.

It is preferred that the majority of the granule is comprised of the carbonate and the acid source and that more 15 preferably the carbonate source and the acid source make up from 50 to 100 wt%, preferably from 60 to 99 wt%, more preferably from 70 to 95 wt%, most preferably from 80 to 90 wt% of the granule.

20 Preferably the effervescent granule comprises from 1 to 15 wt%, preferably from 2 to 10 wt%, more preferably from 3 to 8 wt% of the solid surfactant particles.

The granules preferably have a particle size of from 0.2 to 25 10 mm, preferably from 0.5 to 5 mm, more preferably 0.8 to 4 mm, most preferably from 1 to 2 mm. This helps to provide a highly effective localised fizzing action.

The granule may also comprise a drying agent such as a 30 silica gel to ensure that the granule remains dry during storage.

The granule may also comprise a binder to help hold it together and it is preferred that such a binder is a polyethylene glycol or a polypropylene glycol.

- 5 The granules may advantageously comprise a colourant in order to contrast their appearance from that of the detergent compositions to which they are added.

The Acid Source

10

The acid source reacts with the carbonate source in the presence of water to produce carbon dioxide gas.

- 15 Preferably the acid source is a particulate material and has a narrow particle size distribution such that at least 50 wt%, preferably at least 60 wt%, more preferably at least 70 wt%, most preferably at least 80 wt% of particles have a particle size of from 150 to 350 microns.

- 20 Preferably the acid source is an organic acid. Preferably the acids are mono-, bi- or tri-protonic acids. Such preferred acids include mono- or polycarboxylic acids preferably citric acid, adipic acid, glutaric acid, citramalic acid, tartaric acid, maleic acid, malic acid, 25 succinic acid, malonic acid. Such acids are preferably used in their acidic forms, and it may be preferred that their anhydrous forms are used, or mixtures thereof. Citric acid is the most highly preferred.

The Carbonate Source

The carbonate source reacts with the acid source in the presence of water to produce carbon dioxide gas.

5

The carbonate source is preferably selected from carbonate, bicarbonate, sesquicarbonate and mixtures thereof.

Sodium bicarbonate and sodium carbonate may be
10 advantageously combined in a weight ratio of greater than 3:2, preferably at least 2:1, more preferably at least 3:1.

The Solid Surfactant Particles

15 In order to enhance the fizzing action and to provide a positive cue for the end user, the effervescent granules of the present invention comprise solid surfactant particles. It is preferred that in its isolated state the surfactant is sufficiently solid such that it is pourable.

20

Preferably the surfactant has a melting point of at least 30°C, preferably at least 40°C, more preferably at least 50°C.

25 Surfactants suitable for the present invention meet the criteria of being solid and particulate. Preferably the surfactant is an anionic surfactant. Highly preferred

surfactants are the alkyl sulphate type surfactants, preferably a C₈-C₁₅ primary alkyl sulphate, more preferably a C₁₀-C₁₄ primary alkyl sulphate. Also preferred are the C₈-C₁₅ olefin sulphonates.

5

Preferably the granules are substantially free of alkyl benzene sulphonate surfactants, because of their hygroscopicity. In this context, 'substantially free' means less than 5 wt% of the effervescent granule, preferably less than 3 wt%, more preferably less than 1 wt%, most preferably completely absent.

10

Preferably the surfactant particles have a d₅₀ particle size of greater than 100 microns, more preferably from 150 to 800 microns.

15

In a particularly preferred embodiment, the ratio of the particle size of the effervescent granule to the d₅₀ particle size of the surfactant is greater than 5:1, preferably from 6:1 to 1000:1.

20

The Method of Manufacture

The effervescent granules according to the present invention may be made by any suitable process, such as for example by granulation, roll-compaction, extrusion or a combination thereof.

25

The Detergent Composition

The effervescent granules of the present invention are intended to be added to a conventional particulate laundry
5 detergent composition. When added to a detergent composition they are present at a level of from 0.1 to less than 10 wt%, preferably from 0.5 to less than 4 wt%, more preferably from 0.5 to less than 2 wt%. The benefit of the effervescent granules is surprisingly not diminished at
10 reduced levels of inclusion.

Detergent compositions of the invention contain detergent-active compounds and detergency builders, and may optionally contain bleaching components and other active ingredients to
15 enhance performance and properties.

Detergent-active compounds (surfactants) may be chosen from soap and non-soap anionic, cationic, nonionic, amphoteric and zwitterionic detergent-active compounds, and mixtures
20 thereof. Many suitable detergent-active compounds are available and are fully described in the literature, for example, in "Surface-Active Agents and Detergents", Volumes I and II, by Schwartz, Perry and Berch. The preferred detergent-active compounds that can be used are soaps and
25 synthetic non-soap anionic and nonionic compounds. The total amount of surfactant present is suitably within the range of from 5 to 40 wt%.

Anionic surfactants are well-known to those skilled in the
30 art. Examples include alkylbenzene sulphonates, particularly linear alkylbenzene sulphonates having an alkyl

chain length of C₈-C₁₅; primary and secondary alkylsulphates, particularly C₈-C₁₅ primary alkyl sulphates; alkyl ether sulphates; olefin sulphonates; alkyl xylene sulphonates; dialkyl sulphosuccinates; and fatty acid ester sulphonates. Sodium salts are generally preferred.

Nonionic surfactants that may be used include the primary and secondary alcohol ethoxylates, especially the C₈-C₂₀ aliphatic alcohols ethoxylated with an average of from 1 to 20 moles of ethylene oxide per mole of alcohol, and more especially the C₁₀-C₁₅ primary and secondary aliphatic alcohols ethoxylated with an average of from 1 to 10 moles of ethylene oxide per mole of alcohol. Non-ethoxylated nonionic surfactants include alkylpolyglycosides, glycerol monoethers, and polyhydroxyamides (glucamide).

Cationic surfactants that may be used include quaternary ammonium salts of the general formula $R_1R_2R_3R_4N^+ X^-$ wherein the R groups are long or short hydrocarbyl chains, typically alkyl, hydroxyalkyl or ethoxylated alkyl groups, and X is a solubilising anion (for example, compounds in which R₁ is a C₈-C₂₂ alkyl group, preferably a C₈-C₁₀ or C₁₂-C₁₄ alkyl group, R₂ is a methyl group, and R₃ and R₄, which may be the same or different, are methyl or hydroxyethyl groups); and cationic esters (for example, choline esters).

Detergent compositions suitable for use in most automatic fabric washing machines generally contain anionic non-soap

surfactant, or nonionic surfactant, or combinations of the two in any ratio, optionally together with cationic, amphoteric or zwitterionic surfactants, optionally together with soap.

5

The detergent compositions of the invention also contain one or more detergency builders. The total amount of detergency builder in the compositions will suitably range from 5 to 80 wt%, preferably from 10 to 60 wt%.

10

Suitable inorganic non-phosphorus containing builders include crystalline and amorphous aluminosilicates, for example zeolites as disclosed in GB 1 473 201 (Henkel); amorphous aluminosilicates as disclosed in GB 1 473 202 (Henkel); and mixed crystalline/amorphous aluminosilicates as disclosed in GB 1 470 250 (Henkel); and layered silicates as disclosed in EP 164 514B. Inorganic phosphate builders, for example, sodium orthophosphate, pyrophosphate and tripolyphosphate, may also be present.

20

Aluminosilicates, include the zeolite used in most commercial particulate detergent compositions, namely zeolite A. Advantageously, however, maximum aluminium zeolite P (zeolite MAP) described and claimed in EP 384 070B (Unilever) may be used. Zeolite MAP is an alkali metal aluminosilicate of the P type having a silicon to aluminium ratio not exceeding 1.33, preferably not exceeding 1.15, and more preferably not exceeding 1.07.

25

Suitably the builder system comprises a zeolite (for example zeolite A) and optionally an alkali metal citrate and/or a crystalline layered silicate (for example SKS-6 ex Hoechst).

- 5 Examples of phosphorus-containing inorganic detergency builders include the water-soluble salts, especially the alkali metal salts of pyrophosphates, orthophosphates, polyphosphates and phosphonates.
- 10 The phosphorus containing inorganic builder is preferably pyrophosphate or polyphosphate. Specific examples of inorganic phosphate builders include sodium and potassium tripolyphosphates, orthophosphates and hexametaphosphates.
- 15 Organic builders that may be present include polycarboxylate polymers such as polyacrylates and acrylic/maleic copolymers; monomeric polycarboxylates such as citrates, gluconates, oxydisuccinates, glycerol mono-, di- and trisuccinates, carboxymethyloxysuccinates,
- 20 carboxymethyloxymalonates, dipicolinates, hydroxyethyliminodiacetates, alkyl- and alkenylmalonates and succinates; and sulphonated fatty acid salts. These materials are preferably present in alkali metal salt, especially sodium salt, form. This list is not intended to
- 25 be exhaustive.

Especially preferred organic builders are citrates, suitably used in amounts of from 5 to 30 wt%, preferably from 10 to 25 wt%; and acrylic polymers, more especially acrylic/maleic

30 copolymers, suitably used in amounts of from 0.5 to 15 wt%, preferably from 1 to 10 wt%. Builders, both inorganic and

organic, are preferably present in alkali metal salt, especially sodium salt, form.

Detergent compositions according to the invention may also
5 suitably contain a bleach system. Preferably this will include a peroxy bleach compound, for example, an inorganic persalt or an organic peroxyacid, capable of yielding hydrogen peroxide in aqueous solution. Preferred inorganic persalts are sodium perborate monohydrate and tetrahydrate,
10 and sodium percarbonate. The sodium percarbonate may have a protective coating against destabilisation by moisture. The peroxy bleach compound is suitably present in an amount of from 5 to 35 wt%, preferably from 10 to 25 wt%.

15 The peroxy bleach compound may be used in conjunction with a bleach activator (bleach precursor) to improve bleaching action at low wash temperatures. The bleach precursor is suitably present in an amount of from 1 to 8 wt%, preferably from 2 to 5 wt%. Preferred bleach precursors are
20 peroxycarboxylic acid precursors, more especially peracetic acid precursors and peroxybenzoic acid precursors; and peroxycarbonic acid precursors. An especially preferred bleach precursor suitable for use in the present invention is N,N,N',N'-tetracetyl ethylenediamine (TAED).

25 A bleach stabiliser (heavy metal sequestrant) may also be present. Suitable bleach stabilisers include ethylenediamine tetraacetate (EDTA), diethylenetriamine pentaacetate (DTPA), ethylenediamine disuccinate (EDDS),
30 and the polyphosphonates such as the Dequests (Trade Mark),

ethylenediamine tetramethylene phosphonate (EDTMP) and diethylenetriamine pentamethylene phosphate (DETPMP).

Bleach ingredients are postdosed.

5

The compositions of the invention may contain alkali metal, preferably sodium, carbonate, in order to increase detergency and ease processing. Sodium carbonate may suitably be present in amounts ranging from 1 to 60 wt%,
10 preferably from 2 to 40 wt%. Sodium carbonate may be included in either or both base granule, and/or may be postdosed.

As previously indicated, sodium silicate may also be
15 present. The amount of sodium silicate may suitably range from 0.1 to 5 wt%. Sodium silicate may be postdosed, for example, as granular sodium disilicate, or as sodium carbonate/sodium silicate cogramules, for example, Nabion (Trade Mark) 15 ex Rhodia Chimie.

20

Powder flow may be improved by the incorporation of a small amount of a powder structurant. Examples of powder structurants, some of which may play other roles in the formulation as previously indicated, include, for example,
25 fatty acids (or fatty acid soaps), sugars, acrylate or acrylate/maleate polymers, sodium silicate, and dicarboxylic acids (for example, Sokalan (Trade Mark) DCS ex BASF). One preferred powder structurant is fatty acid soap, suitably present in an amount of from 1 to 5 wt%.

30

Other materials that may be present in detergent compositions of the invention include antiredeposition agents such as cellulosic polymers; soil release agents; anti-dye-transfer agents; fluorescers; inorganic salts
5 such as sodium sulphate; enzymes (proteases, lipases, amylases, cellulases); dyes; coloured speckles; perfumes; and fabric conditioning compounds. This list is not intended to be exhaustive.

10 EXAMPLES

An effervescent granule was made with the following composition:

Ingredient	Wt%
Citric acid	38
Sodium bicarbonate	42
Sodium carbonate	10
Sodium C ₁₂ -14 alkyl sulphate	5
Polypropyleneglycol	4.5
Silica Gel	0.5
Total	100

15

The sodium carbonate had a d₅₀ particle size of about 150 microns. The sodium bicarbonate had a d₅₀ particle size of about 120 microns. The citric acid had a d₅₀ particle size of about 250 microns. The sodium C₁₂-C₁₄ alkyl sulphate was
20 in particulate form (with a melting point in excess of 60°C) and had a d₅₀ particle size of about 200 microns.

- 15 -

The sodium carbonate, sodium bicarbonate, silica gel, sodium lauryl sulphate and citric acid were mixed together to provide a dry-mix. Polypropylene glycol was then added to produce a wetted mixture. The resultant mixture was then
5 granulated in a sieve-type granulator with 2mm holes. The extrudates were then sliced into cylinders with a length of approximately 2 mm.

1 parts of the effervescent granule was mixed with 99 parts
10 of a phosphate detergent powder with a formulation given below:

Ingredient	Wt%
Base Powder	
Sodium C ₁₂ alkyl benzene sulphonate	18.0
Sodium tripolyphosphate	12.0
Sodium silicate	7.5
Sodium sulphate	26.9
SCMC	0.50
Optical brightener	0.18
Photobleach	0.03
Silicone	0.02
Salts + moisture	0.5
Post Dosed	
Sodium carbonate	15.0
Sodium sulphate	10.0
Protease	0.24
Amylase	0.10
Sodium perborate monohydrate	1.50
TAED	0.50
Perfume	0.24
Moisture	6.8
Total	100.00

The resultant detergent powder gave an attractive effervescent action when added to wash water despite the very low level of effervescent granule.

CLAIMS

1. An effervescent granule for use in particulate
detergent compositions which comprises an acid source,
5 a carbonate source and solid surfactant particles.
2. An effervescent granule as claimed in claim 1, wherein
the surfactant has a melting point of at least 30°C,
preferably at least 40°C, more preferably at least
10 50°C.
3. An effervescent granule as claimed in claim 1 or
claim 2, wherein the surfactant is an anionic
surfactant.
15
4. An effervescent granule as claimed in any preceding
claim, wherein the granule is substantially free of
alkyl benzene sulphonate surfactants.
- 20 5. An effervescent granule as claimed in any preceding
claim, wherein the surfactant is an alkyl sulphate type
surfactant.
6. An effervescent granule as claimed in claim 5, wherein
25 the alkyl sulphate surfactant is a C₈-C₁₅ primary alkyl
sulphate.
7. An effervescent granule as claimed in claim 6, wherein
the alkyl sulphate surfactant is a C₁₀-C₁₄ primary alkyl
30 sulphate.

8. An effervescent granule as claimed in any preceding claim, which comprises from 20 to 80 wt%, preferably from 30 to 60 wt%, more preferably from 40 to 50 wt% of the carbonate source.

5

9. An effervescent granule as claimed in any preceding claim, which comprises from 10 wt% to 60 wt%, preferably from 20 wt% to 50 wt%, more preferably from 30 wt% to 40 wt% of the acid source.

10

10. An effervescent granule as claimed in any preceding claim, wherein the carbonate and the acid source make up at from 50 to 100 wt%, preferably from 60 to 99 wt%, more preferably from 70 to 95 wt%, most preferably from 80 to 90 wt% of the granule.

15

11. An effervescent granule as claimed in any preceding claim, which comprises from 1 to 15 wt%, preferably from 2 to 10 wt%, more preferably from 3 to 8 wt% of the solid surfactant particle or particles.

20

12. An effervescent granule as claimed in any preceding claim, wherein the surfactant has a d_{50} particle size of greater than 100 micrometres.

25

13. An effervescent granule as claimed in claim 11, wherein the surfactant has a d_{50} particle size of from 150 to 800 micrometres.

14. An effervescent granule as claimed in any preceding claim, wherein the ratio of the particle size of the effervescent granule to the d_{50} particle size of the surfactant is greater than 5:1, preferably from 6:1 to 1000:1.

15. A laundry detergent composition which comprises from 0.1 to less than 10 wt% of an effervescent granule as claimed in any one of claims 1 to 14.

16. A detergent composition as claimed in claim 15, which comprises from 0.5 to less than 4 wt%, preferably from 0.5 to less than 2 wt%, of the effervescent granule.
